

# While loops and booleans

---

CS195 - Lecture 4

Instructor: Dr. V

- while loops
- code blocks, indentation, IndentationError
  - importance of proper indentation in python
  - importance of proper indentation habits in coding in general
  - folding/unfolding code blocks in editor
  - pass
- boolean expressions
- true/false equivalents
- infinite loops
- nested loops

# What is the purpose of computers?

- More generally, what is the purpose of technology?

# while loop

- what is the purpose of a loop?
  - it's a way to repeatedly do something

# as long as *[condition]* is True, execute *[code block]*  
*[ code before while loop ]*

```
while [condition] :  
    [ code block ]
```

*[ code after while loop ]*

# while loop

```
1
2 # what do you think this code does?
3
4 print('Type a number.')
5 userResponse = int( input('>> ') )
6
7 while userResponse < 100:
8     print('No, type a higher number.')
9     userResponse = int( input('>> ') )
```

```
10
11
12
13
14
15
```

# while loop

```
1
2 # what do you think this prints?
3
4 x = 1
5
6 while x < 5:
7     print(f"x = {x};  x * 2 = {x*2}")
8     x += 1
9
10 print("Done.")
11
12
13
14
15
```

# while loop

```
1
2 # what do you think this prints?
3
4 x = 1
5
6 while x < 100:
7     print(f"{x} = "; {x * 2} = ")    # f-string magic
8     x += 1
9
10 print("Done.")
11
12
13
14
15
```

## while loop syntax - code blocks and indentation

*[ code before while loop ]*

**while** *[condition]* :

*[ code block ]*

*[ code after while loop ]*

- *[ code block ]* starts after a colon
- every line of code in the same *[ code block ]* is indented, all in the same exact way
- *[ code block ]* ends when indentation reverts back

# code blocks

```
1
2 # what do you think this prints?
3
4 x = 1
5
6 while x < 5:
7     print("a" * x)
8     x += 1
9
10    print("Done.")
11
12
13
14
15
```

# code blocks

```
1
2 # what do you think this prints?
3
4 x = 1
5
6 while x < 5:
7     print("a" * x)
8     x += 1
9
10 print("Done.")
11
12
13
14
15
```

# Code indentation

- in Python:
  - correct indentation is part of the syntax
    - your code will not run without correct indentation
    - or your code might do something you didn't intend
- in other programming languages
  - correct indentation is still VERY important
    - you have to be obsessive about proper indentation
    - otherwise, your code becomes
      - unreadable
      - difficult to debug

## while loop - condition

*[ code before while loop ]*

**while** *[condition]* :  
    *[ code block ]*

*[ code after while loop ]*

- *[condition]* is evaluated as a boolean expression
  - a boolean expression evaluates to True or False

# while loop

```
1
2 # x<5 is a boolean expression - it is either True or False
3
4 x = 1
5
6 while x < 5:
7     print(f"{x = }")
8     x += 1
9
10 print("Done.")
11
12
13
14
15
```

# while loop

```
1
2 # what do you think this will do?
3
4 x = 1
5
6 while True:
7     print(f"{x = }")
8     x += 1
9
10 print("Done.")
11
12
13
14
15
```

# beware infinite loops

```
1
2 # what do you think this will do?
3
4 x = 1
5
6 while x > 0:
7     print(f"{x = }")
8     x += 1
9
10 print("Done.")
11
12
13
14
15
```

# beware infinite loops

```
1
2 # what do you think this will do?
3
4 x = 1
5
6 while x != 10:
7     print(f"{x} = ")
8     x += 1
9
10 print("Done.")
11
12
13
14
15
```

# beware infinite loops

```
1
2 # what do you think this will do?
3
4 x = 1
5
6 while x != 10:
7     print(f"{x} = ")
8     x += 2
9
10 print("Done.")
11
12
13
14
15
```

# Boolean conversion

```
1
2 # if your condition is not a boolean expression,
3 #   it will automatically, get converted to a boolean
4
5 while 0:    # equivalent to if bool(0):
6     print("hello")
7
8
9
10
11
12
13
14
15
```

# How other types convert to booleans

```
1 # what do you think each of these prints?
2 print( bool(1) )
3 print( bool(100) )
4 print( bool(-1) )
5 print( bool(0) )
6
7 print( bool(2.3) )
8 print( bool(0.0) )
9
10 print( bool("hello") )
11 print( bool("") )
12
13 print( bool(None) )
14
15
```

# How other types convert to booleans

```
1
2 # what do you think this code does?
3 r = input('>> ')
4 while r:
5     print(f'you said "{r}"')
6     r = input('>> ')
7
8 print('goodbye')
```

9

10

11

12

13

14

15

# Using the walrus operator

```
1
2 # what do you think this code does?
3
4 while r := input('>> '):
5     print(f'you said "{r}"')
6
7
8 print('goodbye')
9
10
11
12
13
14
15
```

# How other types convert to booleans

```
1
2 # what do you think this code does?
3 x = 5
4 while x:
5     print(f'{x = }')
6     x -= 1
7
8
9 # what do you think this prints?
10 print(f'after the loop is over, x is {x}')
11
12
13
14
15
```

# Using the walrus operator

```
1
2 # what do you think this code does?
3 x = 5
4 while x:=x-1:
5     print(f'{x = }')
6
7
8
9 # what do you think this prints?
10 print(f'after the loop is over, x is {x}')
11
12
13
14
15
```

# How booleans convert to other types

```
1 >>> str( True )
2 'True'
3 >>> str( False )
4 'False'
5 >>> float( True )
6 1.0
7 >>> float( False )
8 0.0
9 >>> int( True )
10 1
11 >>> int( False )
12 0
13 >>> 7 + True    # arithmetic operators will auto-cast bool's to int's
14
15
```

# Boolean operators

```
1 x, y = 13, 10
2
3 # what do you think each of these prints?
4 print( x > y )
5 print( x < y )
6 print( x >= y )
7 print( x <= y )
8 print( x <= x )
9 print( x == y )
10 print( x != y )
11
12 # what about these?
13 print( 10 < x < 20 )
14 print( 10 <= x < 20 )
15
```

# Boolean operators

```
1 x, y = "abc", "def"
2
3 # what do you think each of these prints?
4 print( x == y )
5 print( x != y )
6
7 print( x > y )
8 print( x < y )
9 print( x >= y )
10 print( x <= y )
11 print( x <= x )
12
13
14
15
```

# pass

- you can have an empty code block

- use the keyword `pass`; e.g.:

```
[ code before while loop ]
while [condition] :
    pass
[ code after while loop ]
```

- usually `pass` is used as a placeholder
- sometimes it is used because no code is necessary in the code block

# empty code block using pass

```
1
2 # what do you think this code does?
3
4 PASSWORD_PROMPT = 'Please enter a strong password: '
5
6 while (password:=input(PASSWORD_PROMPT)).isalnum():
7     pass
8
9 print(f"{password=}")
```

# Assignment 4

- create an echo bot that does the following:
  1. it says "Hello."
  2. records user input as *userResponse*
  3. as long as user input isn't "q" or "Q"
    - it says "well {*userResponse*} right back at ya"
    - records user input as *userResponse*, again
    - repeat step 3
